10-June-2014

The cosmic ray flux of about  $\sim 1$  particle per  $\text{cm}^2$  per minute at the earth's surface is composed predominately of mu-mesons ( $\mu^\pm$ ). E. P. George was the first use cosmic ray muons for radiography. George measured the stopping rate of muons in order to determine the overburden of a mine tunnel. This technique has since been used for a variety of geological and archeological investigations] We have researched using the multiple scattering of muons for radiography. In addition to providing much more sensitivity than stopping, multiple scattering provides 3-d information, enabling tomography. This technology has recently been chosen for use in studying the damaged cores of the Fukushima Reactors.

# Radioactivity, three discoveries-three Nobel prizes

## **Wilhelm Conrad Roentgen**

Discovered x-rays in 1895  
First Nobel prize in physics 1901

## **Antoine Henri Becquerel**

Discovered Radioactivity in  
1896 shared the Nobel  
prize in physics with **Pierre  
and Marie Curie**, 1903

## **Victor Franz Hess**

1910-1913 showed  
cosmic rays come from  
outside the solar system.  
Shared the Nobel prize in  
1936 with C.D. Anderson

Flux at earth's surface is  
predominately muons

- Letons
- Time dilation

# Muon Interaction with Matter

## Kinematics

particle	mass (MeV)
$e^\pm$	0.5
$\mu^\pm$	105
p/n	940

## Coulomb Interaction

$$\frac{d\sigma}{d\Omega} = \left( \frac{Z_1 Z_2 e^2}{8\pi\epsilon_0 m v_0^2} \right)^2 \csc^4 \left( \frac{\Theta}{2} \right).$$

'LA-UR-13-26416

## Energy Loss

$$\frac{dN}{dx} = \frac{dN}{dE} \frac{dE}{dx}$$

$$\frac{dE}{dx} = KZ^2 \frac{1}{A\beta^2} \left[ \frac{1}{2} \ln \left( \frac{2m_e c^2 \beta^2 \gamma^2 T_{\max}}{I^2} - \beta^2 - \frac{\delta(\beta\gamma)}{2} \right) \right]$$

## Multiple Scattering

$$\frac{dN}{d\theta} = \frac{1}{2\pi\theta_0^2} e^{-\frac{\theta^2}{2\theta_0^2}} d\Omega$$

$$\theta_0 = \frac{14.1}{p\beta} \sqrt{\frac{L}{X_0}}$$

$$\frac{1}{X_0} = \frac{K}{A} \left\{ Z^2 [L_{rad} - f(Z)] + ZL'_{rad} \right\}$$

'LA-UR-13-26416

	dx/dE cm/GeV	x cm
Reactor Core	731.9	8.7
Concrete	254.1	15.8
Fe	88.4	9.5
water	502.5	36.0

# Stopping Cosmic Radiography

Nuclear Instruments and Methods in Physics Research A 356 (1995) 585–595

Method of probing inner-structure of geophysical substance with the horizontal cosmic-ray muons and possible application to volcanic eruption prediction

K. Nagamine <sup>a,b,\*</sup>, M. Iwasaki <sup>a</sup>, K. Shimomura <sup>a</sup>, K. Ishida <sup>b</sup>

# Scattering Cosmic Radiographv

- **Technical approach:**
  - Measure passive radiation
  - Use muons to generate “scattering density” image
    - » Built in momentum measurement
    - » Automatic calibration using flux through empty detector
  - Combine signals to identify threats
- **Advantages over other methods**
  - No radiation
  - Simple technology
  - Inexpensive
  - Can penetrate thick cargos
  - Automatic Identification

# It really works!

# Radiography of Fukushima reactors

11 March 2011 Tohoku Great Earthquake

18500 Deaths due to the earthquake and tsunami.

Economic loss ~\$275 billion

2 weeks after the earthquake  
Cas Milner suggesting using  
muon scattering to look at the  
cores.

Three reactors melted down.

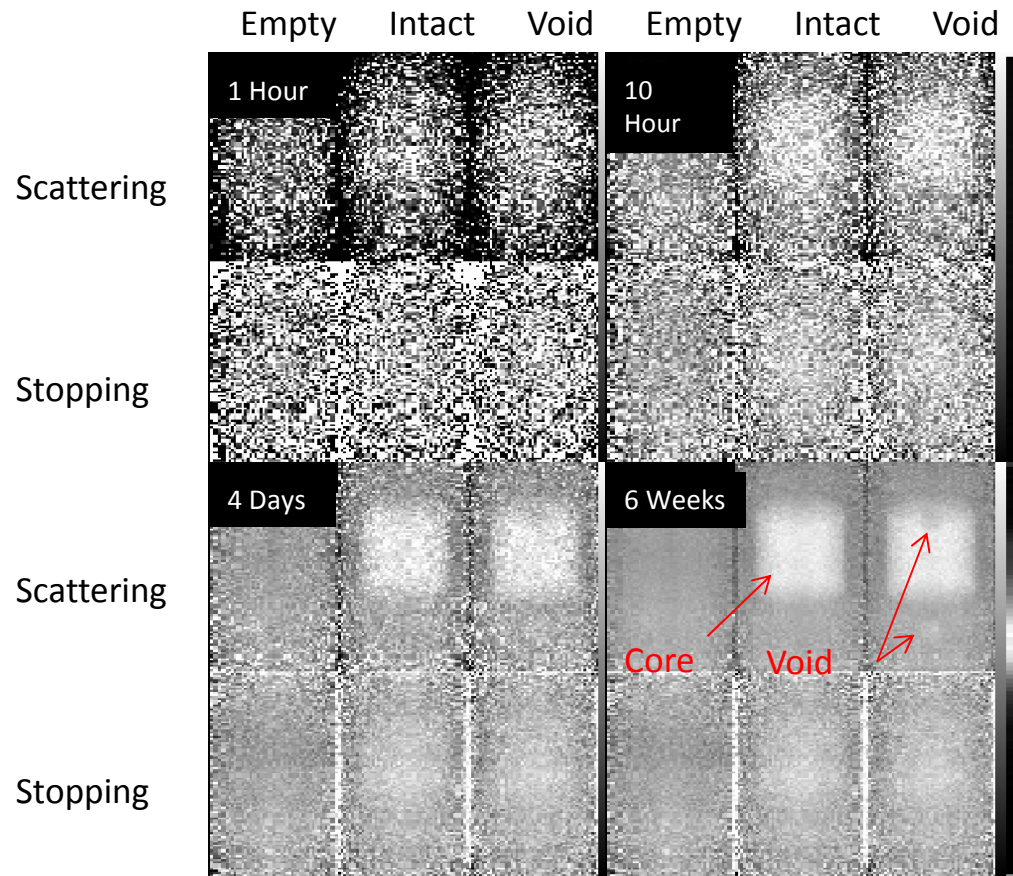

Clean up estimated to take 40 years.

(No prompt deaths due to radiation exposure;

No increased cancer rate; radiation deaths estimated to be negligible. Clean up cost ~\$15-100 billion

# Geant Simulation of Radiography of Fukushima reactors

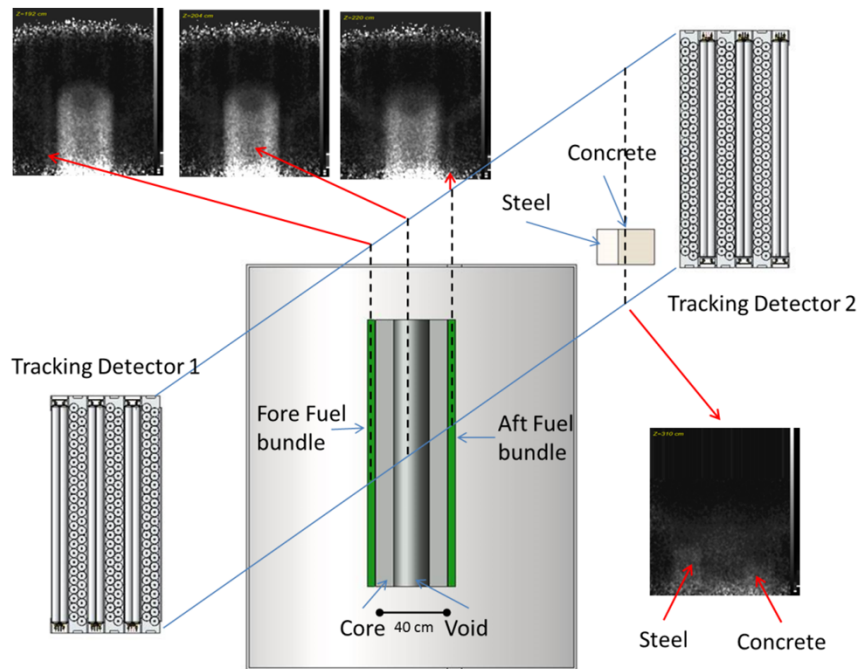

- Scattering Cosmic radiography can be used to image the damaged cores
- Stopping radiography is much more difficult

# Results from Toshiba Nuclear Critical Assembly (NCA) Radiography (350 hrs exposure)

dia

# NCA Results

# Summary

- Cosmic ray radiography
  - Apparatus is simple and robust.
  - In use for border protection (Bahamas)
  - Potential for treaty verification
  - Radiography of Fukushima cores is approved
  - Cosmic rays allow precise assessment (~several %) with 8 weeks of exposure
